

HANDY TIPS

- Be sure to prepare your nappies prior to use. To do this, pre-wash your nappies in warm water 3 times before use. There is no need to dry between these washes. The first few times you use your nappies you may need to change more regularly until they reach full absorbency. This could take up to 6 washes. Soaking overnight in fresh water before the first pre-wash can speed the process up.
- We recommend washing your nappies at least every second day. Washing regularly helps to prevent bacteria from building up, mould from developing and fabric from deteriorating.
- If using barrier creams, ensure you use a liner to protect your nappy fabric. Cream can become clogged in your nappy and cause it to repel urine and leak! You can use reusable or disposable liners.
- Front loaders use less water than top loaders. If using a front loader, you may need to run your nappies through an extra rinse to ensure they are properly cleaned.
- If you own nappies that contain elastic, be sure to hang these horizontally across the line to prevent drag on the elastic.
- Never use bleach or soakers, including Napisan, as they will compromise the waterproofing, elastic and bamboo in your nappies, can cause rashes and will void your warranty.
- Never use fabric softener or vinegar on your nappies. Fabric softener coats the fibres of the fabric, causing them to repel. Vinegar may cause breakdown of the components of your nappy.
- If the weather is very hot, be sure to hang your nappies in the shade or inside. Just as tumble drying at high temperatures reduces the lifespan of your nappy components, so too does drying outside in high heat.
